

The Dalía Lab

Bacteria are found everywhere! They can have appendages that help them move around and pick up things from the environment (kind of like how we have arms and legs). For this coloring page, you will color bacteria that have pili! Pili are a type of appendage that help bacteria stick to surfaces and pick up DNA from the environment. In order to study pili, Jenni from the Dalía lab can edit the DNA of *Vibrio cholerae* to study how pili work in this system! To see the bacteria, Jenni uses a microscope!
